Fall 2020

## Issues

- It may take a few minutes to receive the code for resetting passwords. This is because the server may require some time to create code and send it to the mail server.
- If the user does not receive the verification code mail in the mailbox, please check if the mail is in “spam”.
- If it is too frequent for requesting the verification code with the same mail server, the verification code may not be successfully sent to the corresponding email address. This is because the mail server may recognize our server as hackers and thus temporarily refuse all emails from our server.
- Registration failed may be due to duplicate username, phone number, and email address in the database. If it shows ‘registration failed’, please register it with alternative values.

## Bugs

- None as of the released version.
